

Migrating Your EHR Data Without Disruption

In As Few As 60 Days

Ready to make a switch? Choose Healthjump for your data migration solution.

In as few as 60 days from establishing the connection with your system, Healthjump can securely and effectively migrate your data regardless of your source system.

Vendors often recommend Healthjump because the features include:

- **Fast and easy setup:** Only needs database credentials and an internet connection
- **Seamless migration workflow:** Automated workflows deliver the data directly
- **Use of both systems during migration:** Recurring syncs prevent downtime

Streamlined Implementation Process

- 1 Step 1: Access the Source System**
Accessing the source data uses the Healthjump Agent software and database credentials.
- 2 Step 2: Extract Data from Source**
With 50+ supported EHR/PM systems, data extraction can start immediately.
- 3 Step 3: Data Validation**
Data is aggregated in a staging area where validation scripts look for any anomalies.
- 4 Step 4: Progressive Data Delivery**
A daily routine delivers any updates made to source system. This eliminates any gaps in your patient and/or billing data while both systems are in use during the transition.

Engagement Overview

Data Extraction: The migration process begins with an extraction of over 275 fields of data. No need to pick and choose what stays and what goes over.

Consultation: After initial extraction, we work together to determine if there is too much data or what additional data you may need.

Customization: If you have unstructured data that you'd like to migrate, you'll work with with your migration team to review your options for customized exports.

Examples include:

- Get documents into new EHR
- Migrate attached docs
- Recreate EHR generated docs

50+ EHR/PM systems already supported.
